

Clox does not rely on a single standalone AI tool; instead, it utilizes an **AI-integrated ecosystem** where intelligence is embedded into the core matching algorithms and supported by specialized third-party AI services.

The primary AI-driven capabilities within Clox include:

1. Smart Matching & Recommendation Engine (Internal AI)

The platform uses a proprietary **Auto-Logic Decision Engine** to handle complex logistics variables:

- **System Vehicle Recommendation:** The system automatically calculates the minimum required vehicle based on load dimensions and weight, disabling undersized options to prevent overloading.[1]
- **Capacity Indicators:** It provides real-time suitability feedback using a traffic-light system (Green for perfect fit, Red for risk of overload).[1]
- **Smart Conflict Handling:** If a carrier bids one truck on multiple jobs, the AI automatically expires the other bids once the first job is awarded to prevent double-booking.[1]

2. Location Intelligence & Predictive ETA (Radar.com)

Clox integrates the **Radar.com SDK**, which uses machine learning to provide hyper-accurate location services:

- **Isochrone Geofencing:** Instead of simple distance-based alerts, it uses traffic-aware AI to trigger "15-minute away" notifications based on actual travel time.
- **Automated Dwell Time:** It uses polygon geofencing to precisely record arrival/departure timestamps, which automates waiting-time billing without human intervention.[2]

3. Identity & Document Intelligence (easyAML / Trulioo)

To enforce the platform's "Compliance-First" rule, Clox leverages AI for verification:

- **Biometric IDV:** Uses AI for deep learning-based face matching and liveness detection during onboarding.[3]
- **Intelligent Document Processing (IDP):** Employs AI-powered OCR to extract data from ABN/ACN certificates and licenses with human-level accuracy, identifying fraudulent or expired documents instantly.

4. Revenue & Fraud Protection (Stripe Radar)

Clox uses **Stripe Radar**, which leverages billions of data points across the Stripe network to detect and block fraudulent transactions before they occur.[4] It also utilizes **Smart Disputes**, an AI tool that automatically compiles and submits evidence to fight chargebacks.

5. Fleet+ Profit Engine (Advanced Subscription)

For carrier partners, Clox provides a specialized **Profit Analytics Engine**. This tool uses AI to aggregate multi-source data—fuel logs, driver wages, and maintenance wear—to calculate a real-time **Profitability Score** for every vehicle in the fleet [v21 report].
